

**Listing of Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (currently amended) A venous catheter, comprising:

a body having a proximal end and a distal end, the body having a wall defining a lumen extending from the proximal end to the distal end, the lumen having a longitudinal axis; the body being sized and shaped to afford placement of the cannula in a portion of the venous system of a patient; and

a plurality of inlet apertures in the wall interconnected with the lumen and permitting fluid flow from outside the lumen into the lumen for transport through the lumen, wherein each of the apertures has a longer major axis and a shorter minor axis, and wherein the longer major axis is perpendicular to the longitudinal axis of the lumen.

2. (canceled)

3. (Original) The cannula of claim 1, wherein the apertures are eye-shaped.

4. (Original) The cannula of claim 1, wherein the apertures are oval.

5. (Original) The cannula of claim 1, wherein the apertures are a shape defined by first and second arcuate portions that intersect with one another at two corners.

6. (Original) The cannula of claim 1, wherein the apertures are arranged into a plurality of rows generally extending along the longitudinal axis of the lumen.

7. (Original) The cannula of claim 6, wherein the rows are evenly distributed on the body and the apertures of adjacent rows are offset such that the apertures in the adjacent rows are different distances from a distal tip of the body.

8. (currently amended) A venous catheter, comprising:

a body having a proximal end and a distal end, the body having a wall defining a lumen extending from the proximal end to the distal end, the lumen having a longitudinal axis; the body being sized and shaped to afford placement of the cannula in a portion of the venous system of a patient; and

a plurality of inlet apertures in the wall interconnected with the lumen and permitting fluid flow from outside the lumen into the lumen for transport through the lumen, wherein the apertures are eye-shaped.

9. (canceled)

10. (Original) The cannula of claim 8, wherein each of the apertures has a longer major axis and a shorter minor axis, and wherein the longer major axis is perpendicular to the longitudinal axis of the lumen.

11. (Original) The cannula of claim 10, wherein the apertures are a shape defined by first and second arcuate portions that intersect with one another at two corners.

12. (Original) The cannula of claim 8, wherein the apertures are arranged into a plurality of rows generally extending along the longitudinal axis of the lumen.

13. (Original) The cannula of claim 12, wherein the rows are evenly distributed on the body and the apertures of adjacent rows are offset such that the apertures in the adjacent rows are different distances from a distal tip of the body.

Claims 14-22 (Canceled)
